The invention relates to bovine fertility associated antigen (FAA) and cits nucleic acid sequence. FAA is useful for increasing the stability of the plasma membrane plus acrosome of a sperm cell and/or other portions of a sperm cell, in particular mammalian sperm cell such as a sperm cell from buffalo, cow, horse, mice, pig, sheep, human, avian sperm cell including turkey or chicken sperm cell. FAA is also useful for increasing the fertility of sperm from a mammal including buffalo, cow, horse, mice, pig, sheep or human, or avian (chicken or turkey). FAA is added to the suspension of sperm cells prior to preservation or prior to administration of the sperm cells to a mammal in artificial insemination. Alternatively, fertility of sperm from a mammal is increased by placing calls into the female's reproductive tract by coppulation or artificial insemination. The fertility of the male mammal is increased by injecting faAA into the male mammal's reproductive tract. The present sequence is bovine 22kDa recombinant FAA (rFAA) coding sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches 671;

```

its nucleic acid sequence. FAA is useful for increasing the stability of the plasma membrane plus acrosome of a sperm cell and/or other portions of a sperm cell, in particular mammalian sperm cell such as a sperm cell crom buffalo, cow, horse, mice, pig, sheep, human, avian sperm cell from buffalo, cow, horse, mice, pig, sheep, human, avian sperm cell concluding turkey or chicken sperm cell. FAA is also useful for increasing the fertility of sperm from a mammal including buffalo, cow, horse, mice, pig, sheep or human, or avian (chicken or turkey). FAA is added to the conclusion of sperm cells prior to preservation or prior to administration of the sperm cells to a mammal in artificial insemination. Alternatively, fertility of sperm from a mammal is increased by placing FAA into a female's reproductive tract prior to deposition of the sperm cells into the female's reproductive tract by copulation or artificial consemination. The fertility of the male mammal is increased by injecting FAA into the male mammal's reproductive tract. The present sequence is bovine fertility associated antigen (FAA) partial cDNA. invention relates to bovine fertility associated antigen (FAA)

The invention describes a novel isolated human fertility-associated antigen (FAA) and a bovine FAA polypeptide. Human or bovine FAA is useful for increasing the stability of a sperm cell acrosome and for increasing the stability of a sperm cell acrosome and for increasing the fertility of a human male by administering FAA. Detecting single nucleotide polymorphisms (SNPs) of the human or bovine FAA gene is useful to rasaying fertility by detecting the presence or absence of a FAA SNP con the mammal and correlating the presence or absence of a FAA SNP con the mammal. The FAA SNPs are chosen from FAA SNPs 1-34 given in the specification. FAA SNP is also useful for determining the reproductive citication. FAA SNP is also useful for determining the reproductive citication or bovine, by determining the nucleotide sequence of the FAA SNP, quantifying the fertility of more than one mammal containing creamproductive fitness of the mammals. FAA improves the integrity of sperm membranes and increases the capacitation of sperm derived from either configuration infertile humans. Barly genetic identification of infertility improves the prognosis for subsequent attempts at fertilisation and featility from fertility treatments to avoid costly and/or employed the house of the first first from fertility treatments to avoid costly and/or employed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           bovine

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ър
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              B
                                                                                                     The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumour in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ABN93503-ABN97455 in a cissue sample. The method of the invention has hepatotropic, and cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, of drug toxicity, drug efficacy and drug metabolism.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in comprises a sequence (S) selected from 847 sequences (given in ABL6164 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the cructure and/or properties of the agent. M1 can be used in the create such as colon, breast, stomach, lung, thyroid, cesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating ductal cancer, confirmating lobular cancer, squamous cell carcinoma, neuroendocrine

Horrigan

gene ø set

CC The present invention describes a method (M1) for screening for an claminest continuous continuous captures agent. The method involves exposing cells to a chemical capture to be tested for anti-neoplastic activity, determining a change in cxpression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in cxpression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the creatment of cancer such as colon, breast, stomach, lung, thyroid, cesophageal, ovarian, kidney, prostate or pancreatic cancer, infiltrating ductal cancer, infiltrating ductal cancer, carrings and wilm's times. papillary carcinoma and ous cell carcinoma, Wilm's tumour.

adenocarcinoma, cancerous; ö

```
The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 847 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a structure and/or properties of the agent. MI can be used in the structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 1; SEQ ID 3298; 44pp; English

                                                                                                                                                                                                                                                 В
                                                                                                                                                                                                                                                                             8
                                                                                                                                                                                                                                                                                                                                                                            bronchitts, pneumonia, bronchiectasis, emphysema, asthma, tuberculosis or fungal infections. It can also be used for adjunctive treatment of abscesses or severe closed-space infections in conditions such as empyema, meningitis, peritonitis, sinusitis, otilis, periodontitis, septic arthritis, as well as in topical treatments in a variety of inflammatory and infected lesions, e.g. of the skin and mucosal membranes, surgical wounds, ulcerative lesions and burns. LS-DNase may improve the efficacy of antibiotics used in the treatment of such infections (e.g. gentamicin activity is markedly reduced by reversible binding to intact DNA). It can also be used for the treatment of other con-infected conditions in which there is an accumulation of cellular Cdebris that includes cellular DNA, such as pyelonephritis and conditions to assays of a viscous material (e.g. sputum) from a patient. The anti-LS-DNase antibodies can be used for detection and purification of of LS-DNase antibodies can be used for detection and purification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               620
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      860
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               600
```

The invention relates to detecting (M1) granulocyte (GC) active (GCA), by detecting the level of expression of gene(s) (Gs) iddinated the chip analysis as given in the specification, and comparing the expression level to an expression level in an unactivated GC, where differential expression of Gs is indicative of GCA.

CC that alters the expression of at least one gene in Gs; (2) screening (M3) (for an agent capable of modulating GGA or an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the control in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the chronic) in a tissue, an allergic response in a subject, exposure of gene (s) from Gs, where the level of expression of the gene is indicative of inflammation; or in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by contacting a tissue having or sterile inflammatory disease, by contacting a tissue having or sterile inflammatory disease, by contacting an agent capable of modulating GA preferably in an inflammation in a tissue; M4 is useful for modulating GA, M3 is useful for secrening an agent capable of modulating correcting an inflammation (sepcially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease (e.g. psoriasis, rheumatoid arthritis, creptiusion injury, ARDS, adult respiratory distress syndrome, inflammatory bowel disease, Crohn's disease, ulcerative colitis, periodontal disease, also bacterial infection, viral infection and M5 is useful for treating one of the above conditions. The present correction, but was obtained in electronic for the printed specification, but was obtained in electronic for the printed specification, but was obtained in electronic for the printed specification, but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention describes a novel isolated human fertility-associated antigen (FAA) and a bovine FAA polypeptide. Human or bovine FAA is useful for increasing the stability of a sperm cell acrosome and for increasing the by administering FAA. Detecting single the fertility of a human male by administering FAA. Detecting single incleotide polymorphisms (SNPs) of the human or bovine FAA gene is useful consaaying fertility by detecting the presence or absence of a FAA SNP in the mammal. The FAA SNPs are chosen from FAA SNPs 1-34 given in the specification. FAA SNP is also useful for determining the reproductive fitness of a human or bovine, by determining the nucleotide sequence of the FAA SNP and correlating the fertility of more than one mammal containing the FAA SNP and correlating the fertility of more than one mammal containing the FAA SNP and correlating the ferquency of the FAA SNP to the ceproductive fitness of the mammals. FAA improves the integrity of sperm membranes and increases the capacitation of sperm derived from either fertile or infertile humans. Barly genetic identification of infertility in mproves the prognosis for subsequent attempts at fertilisation and Novel human or bovine fertility-associated antigen useful for stabilising sperm cell acrosome and increasing fertility of a male Claim 1; Fig 2A-E; 54pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          facilitates early intervention to determine whether the individual may benefit from fertility treatments to avoid costly and/or emotional problems with attempted inseminations. This sequence encodes the human fertility-associated antigen (FAA), HC1, one of 4 partial prostate cDN clones of the novel FAA gene described in the method of the invention.
                                                                                                                                                  Deoxyribonuclease; DNase-gammma; selective cleavage; linker; chromatin DNA; cell nucleus; 3'-hydroxy; 5'-phosphate; apoptosis; carcinogenesis; AIDS development; diagnosis; prevention; creatment; cancer; autoimmune disease; viral infections; ds.

DNase-gamma has a mol. wt. of 32000 by SDS-PAGE, or 30000 by gel filtration, an optimum pH of 5.6, is found in the cell nucleus, is not dependent on divalent cations, has a Zn(2+) inhibition IC(50) > ImM and leaves 3'-OH and 5'-P termini after cleavage. The DNase can be used at a mol. level to resolve the control mechanisms of carcinogenesis, the autoimmune system and AIDS development. It can also be used in the diagnosis, prevention and treatment of cancer, autoimmune disease, viral infections, etc., and as an apoptosis control agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI;

A portion of the present sequence was used in Northern blot assays of various murine tissues. Expression of murine LS-DNase can be used for reducing the twiscoelasticity or viscous consistency of DNA-containing material, as well as treatment of systemic lupus erythematosus or pulmonary disease disorders such as cystic fibrosis. It can also be used for adjunctive meningitis. It may improve the efficacy of antibiotics used in the

The invention describes a novel isolated human fertility-associated antigen (FAA) and a bovine FAA polypeptide. Human or bovine FAA is useful for increasing the stability of a sperm cell acrosome and for increasing the fertility of a human male by administering FAA. Detecting single curve fertility of a human male by administering FAA. Detecting single for assaying fertility by detecting the presence or absence of a FAA SNP in the mammal and correlating the presence or absence with the fertility of the mammal. The FAA SNPs are chosen from FAA SNPs 1-34 given in the specification. FAA SNP is also useful for determining the reproductive finness of a human or bovine, by determining the mucleotide sequence of the FAA SNP, quantifying the fertility of more than one mammal containing the FAA SNP and correlating the frequency of the FAA SNP to the membranes and increases the capacitation of sperm derived from either fertile or infertile humans. Early genetic identification and facilitates early intervention to determine whether the individual may facility for the fertility from the fertilisation and
                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
nucleotide polymorphisms (SNPs) of the human or bovine FAA gene is useful for assaying fertility by detecting the presence or absence of a FAA SNP in the mammal and correlating the presence or absence with the fertility of the mammal. The FAA SNPs are chosen from FAA SNPs 1-34 given in the specification. FAA SNP is also useful for determining the reproductive fitness of a human or bovine, by determining the nucleotide sequence of the FAA SNP, quantifying the fertility of more than one mammal containing reproductive fitness of the mammals. FAA improves the integrity of sperm membranes and increases the capacitation of sperm derived from either fertile or infertile humans. Early genetic identification of infertility improves the prognosis for subsequent attempts at fertilisation and facilitates early intervention to determine whether the individual may benefit from fertility treatments to avoid costly and/or emotional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  reproductive HC3; ss.
                                                                                                                                                                                                                                                The invention describes a novel isolated human fertility-associated antigen (FAA) and a bovine FAA polypeptide. Human or bovine FAA is useful for increasing the stability of a sperm cell acrosome and for increasing the fertility of a human male by administering FAA. Detecting single

                                                                                                                                                                                                                                                                                                   The invention describes a novel isolated human fertility-associated antigen (FAA) and a bovine FAA polypeptide. Human or bovine FAA is useful for increasing the stability of a sperm cell acrosome and for increasing the fertility of a human male by administering FAA. Detecting single nucleotide polymorphisms (SNPs) of the human or bovine FAA gene is useful for assaying fertility by detecting the presence or absence of a FAA SNP in the mammal and correlating the presence or absence with the fertility of the mammal and correlating the presence or absence with the fertility of the mammal. The FAA SNPs are chosen from FAA SNPs 1-34 given in the specification. FAA SNP is also useful for determining the reproductive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            fitness of a human or bovine, by determining the nucleotide sequence of the FAA SNP, quantifying the fertility of more than one mammal containing the FAA SNP and correlating the frequency of the FAA SNP to the reproductive fitness of the mammals. FAA improves the integrity of sperm membranes and increases the capacitation of sperm derived from either fertile or infertile humans. Early genetic identification of infertility improves the prognosis for subsequent attempts at fertilisation and facilitates early intervention to determine whether the individual may benefit from fertility treatments to avoid costly and/or emotional problems with attempted inseminations. This sequence encodes the human fertility-associated antigen (FAA), HC4, one of 4 partial prostate cDNA clones of the novel FAA gene described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               206 GGAACCCTTTGTGGTCTGGTTCCAGTCACCCTACACGCTGTCAAGGACTTCGTGATTGT 265
